

IdM Project Team Meeting Notes 2009-04-02

John suggested a standard visual login button for pages that would like to provide an introductory page instead of directly redirecting to the login page. Brett agreed that this would be a good idea. No one volunteered to make such a login button, but Brett will check with Seth Meranda for ideas.

Paul had an update on the new SIS implementation:
Both instances will use the NUID, but the state colleges will populate the NUID into the userid field.

The state colleges do not currently have a common student ID, and they will use the peoplesoft id (consecutive) as the identifier for their SIS implementation.

John demo'd the guest wireless registration.
Some items discussed were terms and expiration, unlimited renewals but expiring every two weeks.
John still has some issues to work out with the system.
Brett suggested developing within a repository so others could contribute to the project.
